                                                     sequence is disclosed as being a protein called BBCS which requires cell death through interaction with Bcl-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the human Bcl-xL/Bcl-2 associated death promoting polypeptide, Bad, the binding of which to Bcl-Xl results in the induction of programmed cell death, i.e. apoptosis. Bad can be used in screening assays for compounds to treat or prevent diseases characterised by apoptotic cell death, such as neurodegenerative disorders, e.g. Alzheimer's and Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa and cerebellar degeneration, and myelodysplastic syndromes, e.g. aplastic anaemia and ischemic injury including myocardial infarction, stroke and reperfusion injury. Assays can also be used to obtain apoptosis enhancing compounds to treat or prevent diseases characterised by the loss of apoptotic cell death, such as an energy and hormone dependent tumours, autoimmune
                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bad gene mediating apoptosis - used to develop products for treating e.g. neurodegenerative disease, cancers or autoimmune disease
                                          The present sequence represents a protein of 166 amino acids. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Bcl-xL/Bcl-2 associated death promoting polypeptide; Bad; programmed cell death; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases, e.g. systemic lupus erythematosus and immune-mediated glomerulonephritis and viral infections, e.g. herpesvirus, poxvirus or adenovirus infection. charter structural and chemical homology with Bel-2, is involved in cell proliferation. Its coding sequence was isolated by screening a synovial tissue cDRA library using a computer search for amino acid sequence alignments. The gene and protein can be used in the treatment of various cancers, disorders with associated inflammation such as Addison's disease, adult respiratory distress syndrome, allergies, anaemia, asthma, atherosclerosis, Crohn's disease, ulcerative colitis, diabetes mellitus, emphysema, glomerulonephritis, gout, Graves' disease, irritable bowel syndrome, lugus erythemation, osteoporosis, rheumatoid arthritis, Sjogren's syndrome and autoimmune thyroiditis, complications of cancer, haemodialysis and extracorporeal circulaing AIDS and other infectious and genetic immunodeficiencies, neurodegenerative diseases such as Alzheimer's disease and Parkinson's disease, ischaemic injuries

(I) comprising a less than full length amino acid sequence of a mutant

Bel-XL/Bel-2 associated cell death regulator polypeptide (BAD) or its

fragment, which contains amino acid substitutions at Seril8 of a human

fragment, which contains amino acid substitutions at Seril8 of a human

EAD, SeriS5 of a murine BAD. (I) has immunostimulant, neuroprotective,

BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective,

noctropic, antiischaemic, vulnerary, cytostatic, antiviral,

antiarthritic, antiinflammatory and immunosuppressive activities, and

can be used as an apoptosis inducer or inhibitor. BAD polypeptides and

polynucleotides can be used for screening candidate compounds and drugs

for activity that promote cell survival or apoptosis. Other uses include

inducing or inhibiting apoptosis in a cell. Candidate compounds

identified and (mutant) BAD polypeptides are useful in treating

death, reperfusion cell death, wound healing, cancer, viral infections,

intriarment and mutant and mutant, anthritis, infertility, inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      autoimmune diseases. The present sequence represents a specifically claimed human BAD mutant amino acid sequence from the present invention.
                                                                                                                                                                                                                                                                                                                     Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; nootropic; antilschaemic; vulnerary; cytostatic; antiviral; autiarthritic; antinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New mutant Bcl-XL/Bcl-2 Associated Cell Death Regulator polypeptide, useful for screening for candidate compounds which induce or inhibit apoptosis, comprises amino acid substitutions at Serl18, Serl55 or Serl13 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to methods of altering the polypeptide levels in a cell, using proteins selected from S-phase kinase associated proteins 1 and 2 (SKP1, SKP2), SKP2-like proteins (ZF) and CUL-1 (a member of the cullin/ CDC53 family of proteins). The method is useful for altering the level of p27, cyclin E, Max, Mad, c-Myc, MDM2, p53, Bax, Bad or Bcl-2 polypeptide in a cell. SKP2 and SKP2-like protein levels are useful for detecting tumours, and in monitoring tumor treatment in a mammal. Agents that modulate interactions between SKP and target proteins are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modulating polypeptide levels in a cell, diagnosing and treating tumor, involves altering levels of proteins such as S-phase kinase associated proteins 1, 2 and cullin/CDC53 proteins -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human protein which is associated with cell proliferation, designated APOP-1. The specification also describes APOP-2 and APOP-3. The APOP polypeptides are useful for diagnosing, preventing or treating disorders associated with abnormal cell proliferation and apoptosis. The polypeptides and composition are particularly useful for treating or preventing cancer (e.g. brain or breat cancer), a disorder associated with an increase in apoptosis (e.g. Alzheimer's disease or Parkinson's disease) or inflammation (e.g. allergies, gout, osteoarthritis or bronchitis).
                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptides associated with cell proliferation, useful for preventing or treating cancer (e.g. brain cancer), a disorder associated with an increase in apoptosis (e.g. Alzheimer's disease) or
brain cancer; breast cancer; Alzheimer's disease; Parkinson's disease;
inflammation; allergy; gout; osteoarthritis; bronchitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (MI) for inducing apoptosis in a cell infected with herpes simplex virus (HSV), which comprises administering to the cell, a composition having an agent that inhibits phosphorylation of pro-apoptotic polypeptide BAD by HSV US3. Also described is a method (M2) for treating a patient infected with HSV, by administering to the patient, a composition comprising a peptide comprising a sequence of 4-100 continuous amino acids of a 168 residue amino acid sequence (see ABB39081), where the peptide comprises seril2, seril5, or their combinations. BAD has virucide activity. MI is useful for inducing apoptosis in a cell infected with HSV, where the cell is in a human. M2 is useful for treating a patient infected with HSV. The present sequence represents human BAD, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducing apoptosis in a cell infected with herpes simplex virus, HSV, by administering to the cell, a composition comprising an agent that inhibits phosphorylation of pro-apoptotic polypeptide BAD by HSV US3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4228) and to cDNAs encoding them (ABD54131-ABO56305), and also encompasses polypeptides 90% identical and polynuclectides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen to polynuclectides and polypeptides in diagnosing, and the use of ovarian antigen polynuclectides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmeorrhoea), endorine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and immunodeficiencies, autoimmune opphoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders and urinary system disorders, neurological disorders, gastrointestinal disorders and urinary system and also he used in forman antigen polypeptides and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present invention describes a chimeric bifunctional molecule (I) comprising at least a first functional molecule covalently linked to a second functional molecule, which is able to modulate the activity of the permeability transition pore complex (PPFC) of the mitochondria.

(I) has the function of specifically targeting and entering a tissue call population. The second functional molecule has the function of specifically targeting and entering a tissue call by apoptosis by requlating the opening or the closing of the PPFC of the mitochondria or its fragment. (I) has virucide, neuroprotective, vasotropic and cytostatic activities, and can be used as a mitochondrial permeability transition pore complex (PPPC) modulator. (I) is useful for treating or preventing a pathological infection or disease. (I) is also useful for regulating cell death regulatory molecules, specifically the apoptogenic function of the PPPC, for treating e.g. cancer, isobaemia, neurodegenerative diseases, fulminant hepatitis or viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a PTPC-interacting TOX peptide which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                               apoptogenic; ischaemia; neurodegenerative disease; fulminant hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                       permeability transition pore complex; virucide; neuroprotective; vasotropic; cytostatic; infection; cell death regulation; apoptosis; mitochondrial permeability transition pore complex modulator; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New chimeric bifunctional molecules that target specific cells and regulate the apoptosis function of the permeability transition pore complex of the mitochondria, useful for treating or preventing e.g. cancer or ischemia -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                            This invention relates to a novel mutant protein which is derived from a wild type human Bc1-2 protein. The mutant is created by replacing a sequence of amino acid residues comprising a flexible loop from the wild type Bc1-2 protein with an amino acid sequence comprising at least two acidic amino acids. The mutant Bc1-2 protein comprises a 166 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the Bc1-2 protein. The protein sequences of the invention are useful in biological assays to identify substances that block the ability of Bc1-2 to inhibit programmed cell death or apoptosis. The present sequence represents a human Bc12 peptide of the invention.
                                                                                                                                                                                                                                             New mutant Bcl-2 proteins derived from a wild type human Bcl-2 protein, useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death or apoptosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
The present invention relates to new peptides that are derived from a wild-type human Bad peptide and are able to bind to a member of the Bol-2 protein family. The peptides are useful, when labelled, in competitive/displacement assays for identifying substances that bind to members of the Bol-2 family and may induce or suppress apoptosis so are potentially useful for treating cancer (inducers) or degenerative diseases or ischemic injury (suppressors). The peptides of the invention have high helix propensity, maintain the contacts of the wild-type Bad peptide and, compared with the Bad peptide, may have better physical properties, particularly solubility. The present sequence represents one of a collection of Bad peptides (AAU78601-AAU78631) that were derived from the BH3 domain of the human wild-type Bad peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel mutant protein which is derived from a wild type human Bcl-2 protein. The mutant is created by replacing a sequence of amino acid residues comprising a flexible loop from the wild type Bcl-2 protein with an amino acid sequence comprising at least two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New mutant Bcl-2 proteins derived from a wild type human Bcl-2 protein, useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death or apoptosis
                                                                   derivatives of Bad peptide, useful for identifying compounds that 1 to Bcl-2 proteins, potential agents for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; Bcl2; BclX1; programmed cell death; apoptosis; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to new peptides that are derived from a wild-type human Bad peptide and are able to bind to a member of the Bol-2 protein family. The peptides are useful, when labelled, in competitive/displacement assays for identifying substances that bind to members of the Bol-2 family and may induce or suppress apoptosis so are potentially useful for treating cancer (inducers) or degenerative diseases or ischemic injury (suppressors). The peptides of the invention have high helix propensity, maintain the contacts of the wild-type Bad peptide and, compared with the Bad peptide, may have better physical properties, particularly solubility. The present sequence represents one of a collection of Bad peptides (AAU78601-AAU78631) that were derived from the BH3 domain of the human wild-type Bad peptide.
acidic amino acids. The mutant Bcl-2 protein comprises a 166 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the Bcl-2 protein. The protein sequences of the invention are useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death or apoptosis. The present sequence represents a human Bcl2 peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          wew uerlvatives of Bad peptide, useful for identifying compounds that bind to Bcl-2 proteins, potential agents for treating cancer and degenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention relates to a novel mutant protein which is derived from a wild type human Bcl-2 protein. The mutant is created by replacing a sequence of amino acid residues comprising a flexible loop from the wild type Bcl-2 protein with an amino acid sequence comprising at least two acidic amino acids. The mutant Bcl-2 protein comprises a 166 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the Bcl-2 protein. The protein sequences of the invention are useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death, or apoptosis. The present sequence represents a human Bcl2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New mutant Bcl-2 proteins derived from a wild type human Bcl-2 protein, useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death or apoptosis

The mutant is created by replacing a sequence of amino acid residues comprising a flexible loop from the wild type Bc1-2 protein with an amino acid sequence comprising at least two acidic amino acids. The mutant Bc1-2 protein comprises a 166 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the Bc1-2 protein. The protein substances that block the ability of Bc1-2 to inhibit programmed cell death or apoptosis. The present sequence represents a human Bc12 peptide of the invention.
                                                                                                                                                                                                                                                                                                                                    New mutant Bcl-2 proteins derived from a wild type human Bcl-2 protein, useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death or apoptosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 583, Application US/09841132
; Sequence 583, Application US/09841132
; Patent No. US20020061848A1
; GENERAL INFORMATION:
    APPLICANT: Bhatia, Ajay
    APPLICANT: Brobst, Peter
    TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT AND
    TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION
    FILER REFERENCE: 210121.46968
; CURRENT APPLICATION NUMBER: US/09/841,132
; CURRENT FILING DATE: 2001-04-23
; NUMBER OF SEQ ID NOS: 599
; SOFTWARE: FastSEQ for Windows Version 3.0/4.0
; SEQ ID NO 583
LENGTH: 1053

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SIMILARITY: BELONGS TO THE BCL-2 FAMILY. CAUTION: Ref.1 sequence differs from that shown due to frameshifts in position 64 and 91.
                                                                                                                                                                                                                                                                                                                                                                                                                           receptor signaling and the apoptotic pathways.
SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein S100A10 (By similarity).
The Ser-75/Ser-99 phosphorylated form binds 14-3-3 proteins (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               phosphorylation, locates to the cytoplasm.
TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.
DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND
BAX for their pro-apoptotic activity and for their interaction
with anti-apoptotic members of the Bcl-2 family.
PTM: Phosphorylated on Ser-75 in response to survival stimuli.
Subsequent phosphorylation on Ser-99 promotes heterodimerization
with 14-3-3 proteins. This interaction then facilitates the
phosphorylation at Ser-118, a site within the BH3 domain, leading
to the release of Bcl-x(L) and the promotion of cell survival.
Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the
                                                                                                                                                                                                                                                                            mutagenesis, and biophysical studies.";
Protein Sci. 9:2528-2534(2000).
-!- FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor
                                                                                                                                                                     MEDINE=21073561; Pubmed=11206074;

Upon phosphorylated form binds 14-3-3 proteins, BCl-The Ser-112/Ser-136 phosphorylated form binds 14-3-3 proteins. The Ser-112/Ser-136 phosphorylated form binds 14-3-3 proteins. SUBCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

PTM: Phosphorylated on Ser-112 in response to survival stimuli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE-95136361; PubMed-7834748;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mol. Cell 6:41-51(2000).

-!- FUNCTION: Promotes cell death. Successfully competes for the binding to Bol-x(L), Bol-2 and Bol-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bol-x(L), but not that of Bol-2. Appears to act as a link between growth factor receptor signaling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Subsequent phosphorylation on Ser-136 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-155, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival Ser-136 is the major site of AKT/PKB phosphorylation, Ser-155 the major site of protein kinase A (CAPK) phosphorylation.

their interaction with Bcl-w in sympathetic neurons.";
Mol. Cell. Neurosci. 17:97-106(2001).
Cell. Neurosci. 18:07-12 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BaX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.
Cell. Suburi: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein $100Al0. The Ser-113/Ser-137 phosphorylated form binds 14-3-3 proteins.
Cell. SUBCELLUIAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PHOSPHORYLATION (BY PKA AND PKB)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          abundant form.

DOMAIN: Intact BH3 domain is required by BIK, BID, BAX, BAD AND BAX for their pro-proptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

PTM: Phosphorylated on Ser-113 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TISOUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S->A: NO HETERODIMERIZATION WITH 14-3-3

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention relates to a peptide conjugate having the formula:

(R.X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached
to the N-terminus of the peptide, or a side chain of the peptide where
the functional group of the side chain is NE2 or OH; or X = O or NH;
when the R-X group is attached to the C-terminus of the peptide, or a
side chain of the peptide, where the side chain functional group is COOH
or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally
monosubstituted with a 1-5C straight or branched chain alkyl group,
phenyl optionally monosubstituted with a 1-5C straight or branched chain
alkyl group, or benzyl. The peptides AAB37001-B37058 represent analogues
of the peptide portion of the conjugate. The peptides represent analogues
of a BC1-2 superfamily polypeptide corresponding to amino acids 72-97 of
the BH3 domain of the cell death agonist Bad. The peptide conjugate is
useful for modulating apoptosis in the cells of a subject, or for
reversing B cell lymphoma/leukemia 2 (BC1-2)-mediated blockage of
apoptosis in cancer cells. It is also useful for inhibiting BC1-2
function. In particular, the peptide conjugate is useful for treating a
subject afflicted with a cancer characterized by cancer cells that
express BC1-2. The cancer includes prostate, colorectal, gastric,
non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritc; antiinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                  New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ·;
